

Performance Improvement Modification - Effective 9/18

Manual Actuator

The improved design of the new threaded cylinder and drive screw now offer 13% more actuator total travel (.051"/1.3mm) and 12% more bearing area on the drive screw.

The original threaded cylinder and drive screw would expand our ID Xpansion™ Clamp between 0.013-0.014 (0.33-0.036mm). The improved components will expand our ID Xpansion™ Clamp in the range of 0.0175 (0.45mm).

Note for replacements: If you need to purchase a replacement cylinder or drive screw they must be purchased together. The original components will not work with improved version. *For example:* If you require a replacement cylinder you must also purchase the drive screw as the old drive screw is not compatible with the new cylinder and vice versa.

Note: The body of the actuators did not change.
